The BSG sequences are also referred to as breast specific markers (BSM). The invention relates to methods for diagnosing, monitoring, staging, imaging and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, tissues or body fluids of the patient

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene therapy.
                                                                                                                                        Fong S;
Hillan KJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of auti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 GACGCCCAGTGACCTGCCGAGGTCGGCACACAGAGCTCTGGAGATGAAGACCCTGTTCC 60

The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angion, and angina, mycoardial infarctions, thromophlealitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Baker KP, Ferrara N, Gerber H, Gerritsen ME, Goddard A;

                                                                                                                                                                                                                                                                                                     AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, anglogenesis; PRO protein; cardiovascularisation; wound; cancer; atherosclerosis; cardiac hypertrophy; gene therapy; endothelial disorder; cardiant; cytostatic; antianglogenic; hypotensive; vulnerary; antianteriosclerotic; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions

ABB86072 to ABL88288 encode the PRO proteins given in ABB84817 to
MABB86003. The PRO proteins and polynucleotides have cardiant, cytostatic,
antiangiogenic, hypotensive, vulneary and antiatreinsolaterotic
activities, and can be used in gene therapy. The PRO polynucleotides,
cardiavascular, endothelial or angiogenic distorder in a mammal,
e.g. cardiac hypertrophy, trauma, cancer, age-related macular
c.g. cardiac hypertrophy, mycardial infarctions, thromopophietits,
imphangitis, tumour anglogenesis (such as breast carcinoma and liver
corcinoma) and wound healing. The PRO polynucleotides have applications
in molecular biology, including use as hybridisation probes, and in
chromosome and gene mapphing. ABL88259 to ABL88257 represent primers and
probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                           Baker KP, Ferrara N, Gerber H, Gerritsen ME, Goddard A;

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-alpha. OBPS provide long-term retention (gradual release) of lipophilic compounds, so proflong the 'hold' of perfumes, deadorants etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect controlling volatilisation of an odorant, specifically in perfumes, controlling volatilisation of an odorant, specifically in perfumes, odorants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to sclubilisal lipophilic compounds, for treating hyperlipidemia or obesily, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a delayed release) but also for delivery acids, as food additives; as a delayed release) but also for delivery across the placental barrier foeto placental pathology (rupture of the amnictic membrane); and as antiallergic agents.
                                                   Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                 Location/Qualifiers

The present sequence encodes a human odorant binding polypeptide (OBP), C designated obPrID-beta (long form). OBPs provide long-term retention C designated obPrID-beta (long form). OBPs provide long-term retention CC (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, decodrants etc.. OBP polypeptides are used as binding proteins for hydropholic ligands (particularly odorants), as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; commetics or distilisation of an odorant, specifically in perfumes, octants or flavours, e.g. human pheromones, for binding to OBP also in CC analysis of complex perfume mixtures; to sclubilise lipophilic compounds; or trasporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery acids, as food additives; as a trasporter of pharmaceuticals, especially anticancer agents (providing coeto-placental pathology (rupture of the amniotic membrane); and as mitallergic agents.
                                                                                                                                                                                                                                                      Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes \,
                                                                                                                                                                                                                                                                                                                                                         Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPIIa-alpha. OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect specific antibodies for diagnosis of allery, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, ocemetics or disinfectant compositions; to screen compounds, especially comments of complex perfume mixtures; to screen compounds, especially complexed to complexe or solubilise lipophilic compounds; of analysis of complex perfume mixtures; to stowellise lipophilic compounds; confirmed hyperlipidemia or obesity, or to supplement non-maternal mix when combined with nutritional fatty acids, as food additives; as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           designated OBPIIa-beta. OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, decorants etc.. OBP polymeptices are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors of agonists or anteaponists) of cellular lipocalcin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, controlling volatilisation of an odorant, specifically in perfumes, odorants or flavours, e.g. buman pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to screen compounds, especially of treating hyperlipidemia or obesity, or to supplement non-maternal mix when combined with untritional fatty acids, as food additives; as a controlling dalayed release) but also for delivery across the placental partier (e.g. for detoxification of the foetus); as a marker of pregnancy or series incomplement of the amniotic membrane); and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.

```
The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPIRa-gamma. OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (appoints or antagonists) of cellular lipopaloin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, commercial or disinfectant compositions; to screen compounds, especially controlling volatilisation of an obesity, or to supplement non-maternal milk when complex perfume mixtures; to screen compounds, especially anticance agents (providing transporter of pharmaceuticals, especially anticancer agents (providing transporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery across the placental barrier of controlling control the foctus; as a marker of pregnancy or controlling complex placents placed as a marker of pregnancy or controlling complex placents as a marker of pregnancy or controlling complex placents.) as a marker of pregnancy or controlling complex placents placents placed as expected as a control particle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
                                                                                                               New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      63 GGIGTCACGCTCGGCCTGGCCGTGCCTTTCACCCTGGAGGAGGAGGATATCACA 122

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or PolyAk RNAs derived from 30 different tissues. ESP sequences usually correspond mainly to the 3' untranslated region (URF) of the mRNA because they are often obtained from oilgo-dr primed CDNA libraries. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from CDNAs with intact 5' ends and can therefore be used to obtain full length green was an ender an equal sequences may be sequenced and squanchic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                          New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining CDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures -

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Anotes "Vector: pBluescript II SK-; Site_1: EcoRI; Site_2: Xho1; This library, constructed by John Davies and Jeffrey McDermott, comblose Sonsa from C-1690 cells grown to mid-log plase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. Polya mank was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratageme) in the EcoRI (5') and Xho1 (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with Exassist (Stratageme) phage. The library was normalized using method 4 described in Bonalde et al (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chlamydomonas reinhardtii.

/note="vector: ppluescript II SK-; Site_I: ECORI; Site_2:
Nho.: Deflagellation library, constructed by John Davies
and Jeffrey MoDermoch, combines connas from CC-1690 cells
which had been re-synthesizing flagella for 15, 30 and 60
min after being deflagellated by ph shock. PolyA mRNA was
purified from each sample, pooled and cDNA synthesized.
The cDNA was directionally cloned into lambda Zap II
(Stratagene) in the EcoRi (5') and XnORI (3') sites
pBluescript II SK- plasmids were excised from the lambda
Zap clones by superinfection with Exassist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al., (1996) Genome Research 6: 791-806."
